

Solutions. Technology for your ideas.

Using this tensioning system ceiling elements can be removed on either side by up to 50% offering easy access to technical installation above the mesh. Even for larger elements this can be done by only one person when using the corresponding tool. The wire cloth elements won't be damaged, as they remain in the ceiling construction at all times.

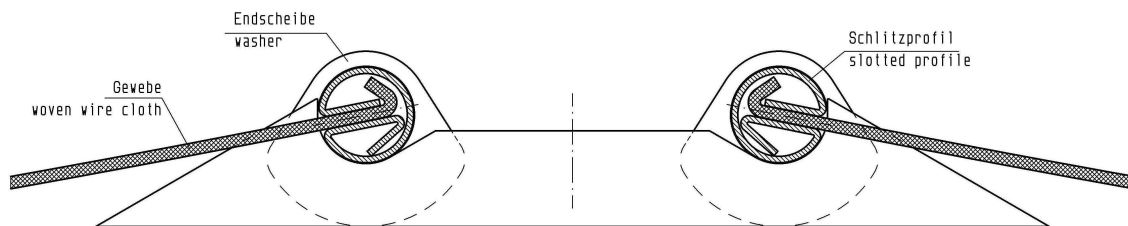

<-->

Removing the panel

Each element is equipped with slotted profiles, which are fastened on the substructure on both sides using special brackets (see detail below).

To remove a panel, it is slightly lifted in the center to reduce the tension. Then the slotted profiles can be taken out of the fastening bracket and slid to the center on the substructure. Discs at the ends of the slotted profile make sure, that the profile remain in the ceiling construction.

Horizontal mounting systems removable – with sag
